

Detailed Migration Report

Evidence-backed migration summary, technical progress, validation, and limitations

Executive Summary

This migration moved the application from Spring Boot 2.1 / Java 11 to Spring Boot 2.7 / Java 11.

Key Metrics

Tests executed	0
Tests passed	0
Repair attempts	0

Migration Story

The migration focused on a single included unit: an automated Stage 1 transition from the project’s detected source profile "Spring Boot 2.1 / Java 11" toward the target profile "Spring Boot 2.7 / Java 11".

The run explicitly excluded Stages 2-4, so the delivered work and artifacts are scoped to the initial planning, analysis, assessment, and sandbox transform for that first stage.

The job was created and queued on 2026-07-10T15:13:54.934334Z and Stage 1 started immediately thereafter.

Stage 1 began with an analysis phase that completed within the first several minutes; planning and assessment phases then completed in rapid succession.

The system produced a broad set of artifacts during these phases : analysis_report, assessment_report, dependency_graph, target_dependency_plan, migration_plan.yaml, rewrite_preview, rewrite_patch, rewrite_impact_summary, and multiple summaries and inventories : which collectively capture the detected state, recommended changes, and an automated rewrite dry-run.

The analysis and planning outputs were written before the approval gate was reached.

Operationally the approval flow recorded both an auto-

approval enablement and subsequent human approval activity.
Auto Approval was enabled early in the run, and the approval gate was auto-approved; the timeline also records multiple human approval decisions being recorded and completed. After approvals were recorded, the orchestrator resumed and a sandbox transform was started and completed; sandbox transform completed at 2026-07-10T15:22:55.957768Z.
Final report generation and a stage report were produced immediately after the transform.

Despite the sandbox transform, measured line- and file-level impact for this migration is zero: files_changed 0, lines_added 0, lines_changed 0, lines_deleted 0. The rewrite artifacts (rewrite_dry_run, patch, rewrite_patch, rewrite_preview) were generated and saved as evidence of proposed edits, but no on-repo changes are recorded by this run.
Repair attempts are zero and no repair actions were required or executed during Stage 1.

Validation outcomes are partially recorded: planning, assessment, and artifact generation completed successfully and a final stage report was written.
Test execution and build status are not captured in the evidence (test_totals show zero tests and build_status is "not captured"), and proof_level and transform_status fields are also "not captured."
These gaps mean there is no recorded test pass/fail signal or verified build result from this run.

Remaining limitations and next considerations are therefore explicit in the evidence:
Stage 1 has produced a complete set of analysis and plan artifacts and a successful sandbox transform, but there is no captured result for builds or tests, no recorded

Migration Scope

- Source profile: Spring Boot 2.1 / Java 11
- Target profile: Spring Boot 2.7 / Java 11
- Included stages: 1
- Skipped earlier stages: none
- Excluded later stages: 2, 3, 4

Stage-by-Stage Technical Details

Stage 1: Spring Boot 2.1 / Java 11 to Spring Boot 2.7 / Java 11

Report Provenance and Limitations

- Narrative generation: azure_openai (live_ok)
- Line metrics exclude binary files, generated build output, dependency caches, and files larger than 5 MiB.
- LLM narrative is advisory; deterministic metrics and persisted stage evidence are authoritative.
- The report describes sandbox migration execution and does not claim production deployment or production validation.
- Report generated at: 2026-07-10T15:26:53Z
- Migration job: 7e0f11dd83a647fb88a3b72cbcd031ec
